## **NEWS RELEASE**

March 25, 2004

### **BULK SAMPLING GOLD ASSAYS OF 48.3, 40.5, 35.2 and 43 g/t AT T'BOLI AND COMVAL GOLD PROJECTS**

Sur American Gold Corporation is very pleased to provide an update on exploration at its Comval and T'Boli gold projects, Philippines.

#### **Highlights include:**

- **Two 20kg bulk samples at the T'Boli south and north veins respectively returned 48.3 g/t and 40.5g/t gold respectively. Silver assays are pending. The high grade results continue to support the view that significant amounts of high grade but soft clay zones in the deposit were not recovered during previous drilling programs and therefore actual overall grades at T'Boli may be higher than the quoted 5.5g/t gold and 21g/t silver.**
- **Underground sampling at T'Boli also confirms that wide (up to 30m) well mineralized gold-silver haloes exist on either side of the known vein systems. This opens up the possibility of the use of bulk mining methods in some areas of the T'Boli system.**
- **At the Comval project a new vein called Tarale 1000 has been discovered (as a result of a recent landslip) in the eastern sector of the Tarale zone of Batoto. Surface samples initially returned between 2.5-4.5g/t gold but as the development of the 1.2 metre wide vein advanced the average grade based on composite sampling of random samples from 25, 30kg bags of mineralization returned 43g/t gold.**
- **Bulk sampling of approximately 2 tonnes of another Tarale vein (Tarale 11) returned a weighted average of 35.3 g/t gold. These latest results confirm the original channel sample over the 0.75m wide vein of 27g/t gold.**
- **Exploration continues to extend the size of the Batoto alteration/mineralized system to the southwest. Eight new structures have been discovered in the last week. These are in addition to the typical gold bearing Batoto stockwork veins, veinlets and microveinlets.**

- **5.5 line km of the gradient array induced polarization geophysical survey has now been completed.**

## **T'BOLI GOLD PROJECT**

Extensive sampling in the vicinity of the T'Boli north and south vein sets continues to confirm that wide mineralized alteration zones averaging 0.72g/t gold and 5g/t silver exist up to 30 metres either side of the main veins. This work opens up the possibility of bulk mineability in certain areas of the project area.

Bulk sampling (20kg) within the T'Boli south vein returned 48.3 g/t gold and within the T'Boli north vein (again 20kg) returned 40.5 g/t gold. Typical silver:gold ratios are about 5:1. The silver assays will be reported shortly.

## **COMVAL GOLD PROJECT**

Bulk sampling of the Batoto veins continued in preparation of the planned processing of a 300 tonne sample for metallurgical test purposes. The sampling results continue to demonstrate the consistently high grade nature of the Batoto veins.

All sampling practices are approved by Mr Rennie Blair, Company President who is the qualified person as required by National Policy 43-101.

Sur American Gold Corporation trades on the TSX Venture Exchange (Canada) with trading symbol SUR-V.

On behalf of the board of directors,

J. Rennie Blair  
President
